### **\*Environmental Sample Collection**

The National Poultry Improvement Plan (NPIP) lists appropriate samples and collection guidelines for environmental testing for poultry facilities in their program standards (poultryimprovement.org). When submitting a sample for testing, please observe the following guidelines (note: NPIP samples will be rejected for testing if they are not collected and stored as stated below):

- Samples must be collected with pre-moistened swabs, sponges, boot covers, gauze pads or other sterile collection devices. If collection devices do not come pre-moistened, use Double Strength Skim Milk (DSSM) or chicken broth (Rolfe et. al., 2000) to moisten collection devices before and after collection as needed. Litter and Fluff samples can be placed directly into a sterile bag and submitted dry, or swabbed with pre-moistened gauze or sponge. Collect meconium in a sterile container, at least 25 grams is needed for testing.
- Place samples in a clearly labelled sterile bag or container, taking care not to rip or tear bags.
- Moistened samples require refrigeration (2-4 °C) after collection. Ship samples to the lab with ice packs as soon as possible after collection. Do not freeze samples.
- Samples must arrive at the lab within 24-72 hours of collection. Avoid shipping over weekends when possible. Samples can be refrigerated no more than 5 days before testing (Samples moistened with DSSM must be tested within 3 days of collection).
- Please submit samples with a list of sample IDs and collection dates, or email this list in advance to sdsu.bacteriology@sdsu.edu

### **\*NPIP Testing for Salmonella Enteritidis / NPIP U.S. Sanitation Monitored**

Samples for NPIP testing will be evaluated upon arrival at the laboratory for adherence to the NPIP guidelines (see above). If the samples do not meet the collection guidelines (past 5 days of collection, not cool, not moistened, inappropriate sample), samples will be rejected for NPIP testing and will be tested as environmental monitoring samples.

#### **Testing to include:**

- Screening of samples with molecular methods
- Culture of all positives for Salmonella sp.
- Serogrouping of all Salmonella isolates
- Serotyping of all group D1 Salmonella sp. at NVSL in Ames, IA. (additional \$2 per sample for Serotyping)

### **Environmental Monitoring for Salmonella sp., Yeast/Mold and coliform counts**

This test is for in-house environmental monitoring for Poultry facilities. **Samples that do not meet NPIP collection standards will be tested under this procedure. The molecular method available for this test is a non-NPIP method.** Yeast/Mold and Coliform counts are also available.

#### **Testing to include:**

- Screening of samples with molecular methods
- Culture of all positives for Salmonella sp.
- Serogrouping of all Salmonella isolates
- Serotyping of one Salmonella sp. of each group isolated per case at NVSL in Ames, IA. (additional \$2 per sample for Serotyping)
